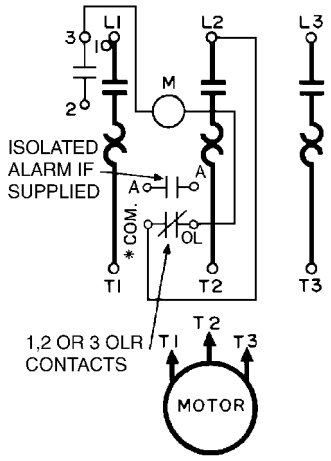
WIRING DIAGRAM

A wiring diagram shows, as closely as possible, the actual location of all component parts of the device. The open terminals (marked by an open circle) and arrows represent connections made by the user.

Since wiring connections and terminal markings are shown, this type of diagram is helpful when wiring the device or tracing wires when troubleshooting. Bold lines denote the power circuit and thin lines are used to show the control circuit. Black wires are conventionally used in power circuits and red wire in control circuits for AC magnetic equipment.

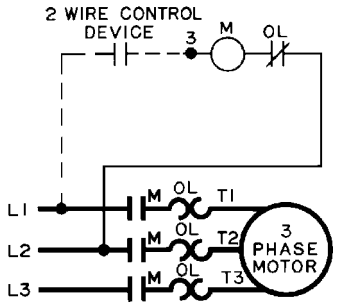
A wiring diagram is limited in its ability to completely convey the controller's sequence of operation. The elementary diagram is used where an illustration of the circuit in its simplest form is desired.



ELEMENTARY DIAGRAM

An elementary diagram is a simplified circuit illustration. Devices and components are not shown in their actual positions. All control circuit components are shown as directly as possible, between a pair of vertical lines representing the control power supply. Components are arranged to show the sequence of operation of the devices and how the device operates. The effect of operating various auxiliary contacts and control devices can be readily seen. This helps in troubleshooting, particularly with the more complex controllers.

This form of electrical diagram is sometimes referred to as a "schematic" or "line" diagram.



Examples of Control Circuits

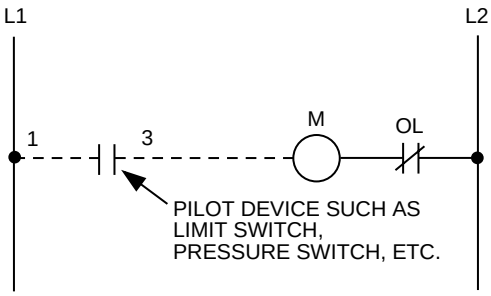
2- and 3-Wire Control
Elementary Diagrams

Low Voltage Release and Low Voltage Protection are the basic control circuits encountered in motor control applications. The simplest schemes are shown below. Other variations shown in this section may appear more complicated, but can always be resolved into these two basic schemes.

Note: The control circuits shown in this section may not include overcurrent protective devices required by applicable electrical codes. See page 11 for examples of control circuit overcurrent protective devices and their use.

Low Voltage Release: 2-Wire Control

FIG. 1



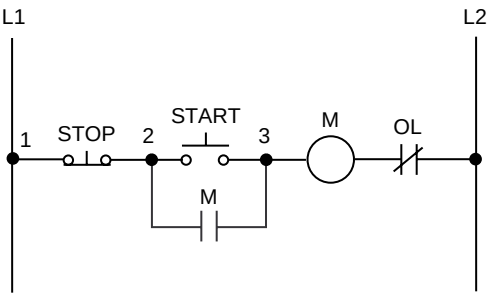
Low voltage release is a 2-wire control scheme using a maintained contact pilot device in series with the starter coil.

This scheme is used when a starter is required to function automatically without the attention of an operator. If a power failure occurs while the contacts of the pilot device are closed, the starter will drop out. When power is restored, the starter will automatically pickup through the closed contacts of the pilot device.

The term “2-wire” control is derived from the fact that in the basic circuit, only two wires are required to connect the pilot device to the starter.

Low Voltage Protection: 3-Wire Control

FIG. 2



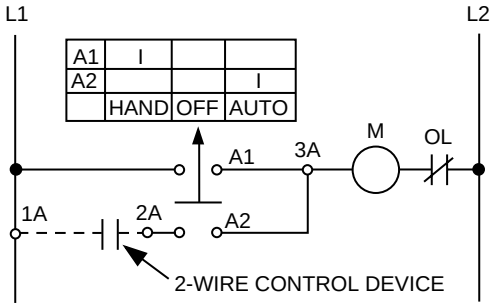
Low voltage protection is a 3-wire control scheme using momentary contact push buttons or similar pilot devices to energize the starter coil.

This scheme is designed to prevent the unexpected starting of motors, which could result in injury to machine operators or damage to the driven machinery. The starter is energized by pressing the Start button. An auxiliary holding circuit contact on the starter forms a parallel circuit around the Start button contacts, holding the starter in after the button is released. If a power failure occurs, the starter will drop out and will open the holding circuit contact. When power is restored, the Start button **must** be operated again before the motor will restart.

The term “3-wire” control is derived from the fact that in the basic circuit, at least three wires are required to connect the pilot devices to the starter.

2-Wire Control: Maintained Contact Hand-OFF-Auto Selector Switch

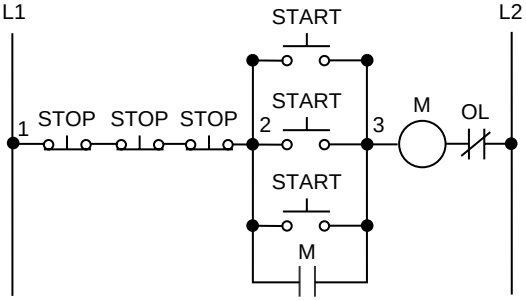
FIG. 3



A Hand-Off-Auto selector switch is used on 2-wire control applications where it is desirable to operate the starter manually as well as automatically. The starter coil is manually energized when the switch is turned to the Hand position and is automatically energized by the pilot device when the switch is in the Auto position.

3-Wire Control: Momentary Contact Multiple Push Button Station

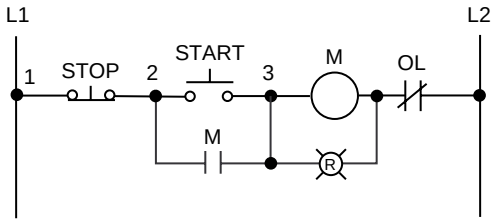
FIG. 4



When a motor must be started and stopped from more than one location, any number of Start and Stop push buttons may be wired together. It is also possible to use only one Start-Stop station and have several Stop buttons at different locations to serve as an emergency stop.

3-Wire Control: Pilot Light Indicates when Motor is Running

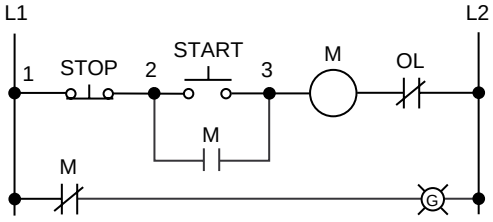
FIG. 1



A pilot light can be wired in parallel with the starter coil to indicate when the starter is energized, indicating the motor is running.

3-Wire Control: Pilot Light Indicates when Motor is Stopped

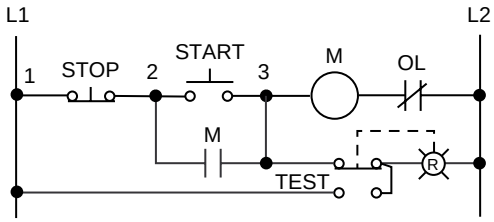
FIG. 2



A pilot light may be required to indicate when the motor is stopped. This can be implemented by wiring a normally-closed auxiliary contact on the starter in series with the pilot light, as shown above. When the starter is deenergized, the pilot light illuminates. When the starter picks up, the auxiliary contact opens, turning off the light.

3-Wire Control: Push-to-Test Pilot Light Indicates when Motor is Running

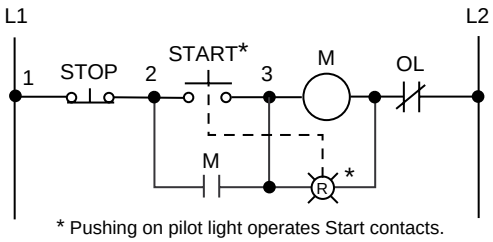
FIG. 3



When the Motor Running pilot light is not lit, there may be doubt as to whether the circuit is open or whether the pilot light bulb is burned out. To test the bulb, push the color cap of the Push-to-Test pilot light.

3-Wire Control: Illuminated Push Button Indicates when Motor is Running

FIG. 4

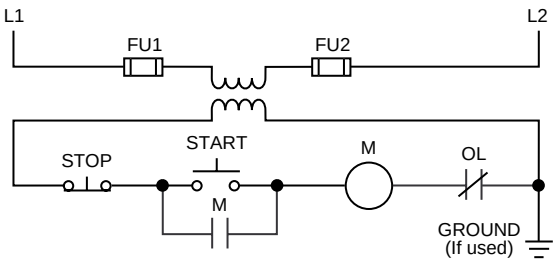


* Pushing on pilot light operates Start contacts.

The illuminated push button combines a Start button and pilot light in one unit. Pressing the pilot light lens operates the Start contacts. Space is saved by using a two-unit push button station instead of three.

3-Wire Control: Fused Control Circuit Transformer

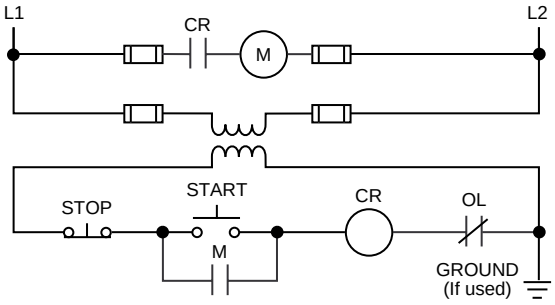
FIG. 5



As an operator safety precaution, a step-down transformer can be used to provide a control circuit voltage lower than line voltage. The diagram above shows one way to provide overcurrent protection for control circuits.

3-Wire Control: Fused Control Circuit Transformer and Control Relay

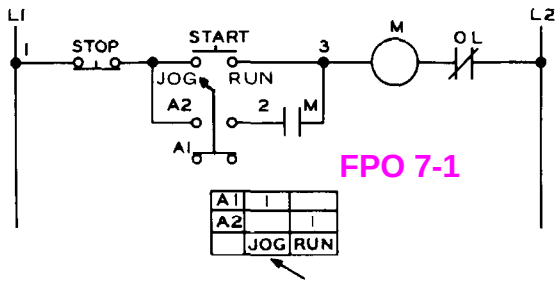
FIG. 6



A starter coil with a high VA rating may require a control transformer of considerable size. A control relay and a transformer with a low VA rating can be connected so the normally-open relay contact controls the starter coil on the primary or line side. Square D Size 5 Combination Starter Form F4T starters use this scheme.

Jogging: Selector Switch and Start Push Button

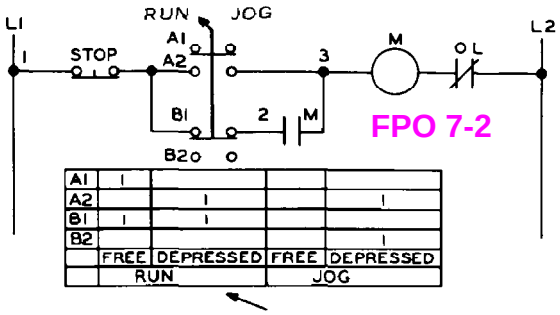
FIG. 1



Jogging, or inching, is defined by NEMA as the momentary operation of a motor from rest for the purpose of accomplishing small movements of the driven machine. One method of jogging is shown above. The selector switch disconnects the holding circuit contact and jogging may be accomplished by pressing the Start push button.

Jogging: Selector Push Button

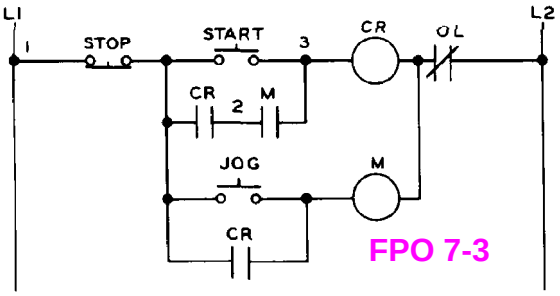
FIG. 2



A selector push button may be used to obtain jogging, as shown above. In the Run position, the selector-push button provides normal 3-wire control. In the Jog position, the holding circuit is broken and jogging is accomplished by depressing the push button.

Jogging: Control Relay

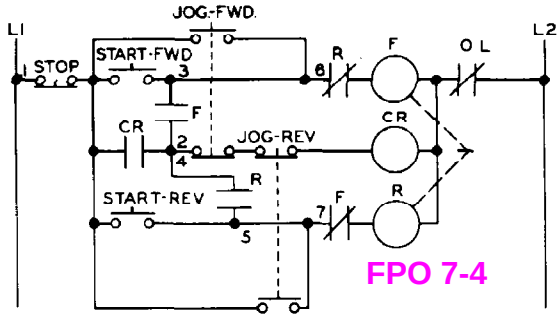
FIG. 3



When the Start push button is pressed, the control relay is energized, which in turn energizes the starter coil. The normally-open starter auxiliary contact and relay contact then form a holding circuit around the Start push button. When the Jog push button is pressed, the starter coil is energized (independent of the relay) and no holding circuit forms, thus jogging can be obtained.

Jogging: Control Relay for Reversing Starter

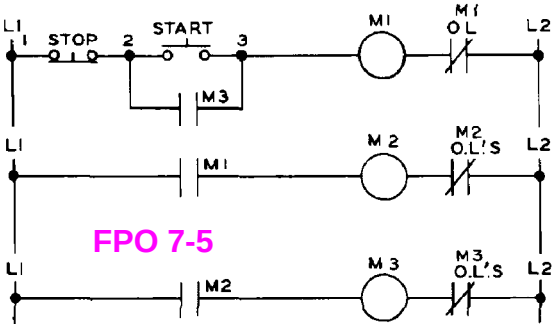
FIG. 4



This control scheme permits jogging the motor either in the forward or reverse direction, whether the motor is at standstill or rotating. Pressing the Start-Forward or Start-Reverse push button energizes the corresponding starter coil, which closes the circuit to the control relay.The relay picks up and completes the holding circuit around the Start button. As long as the relay is energized, either the forward or reverse contactor remains energized. Pressing either Jog push button will deenergize the relay, releasing the closed contactor. Further pressing of the Jog button permits jogging in the desired direction.

3-Wire Control: More than 1 Starter, 1 Push Button Station Controls all

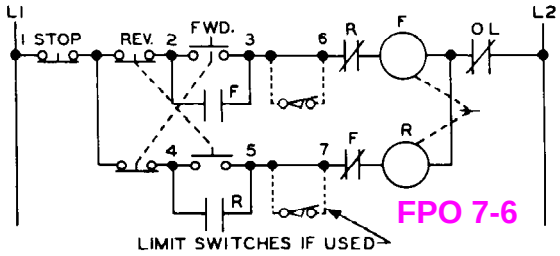
FIG. 5



When one Start-Stop station is required to control more than one starter, the scheme above can be used. A maintained overload on any one of the motors will drop out all three starters.

3-Wire Control: Reversing Starter

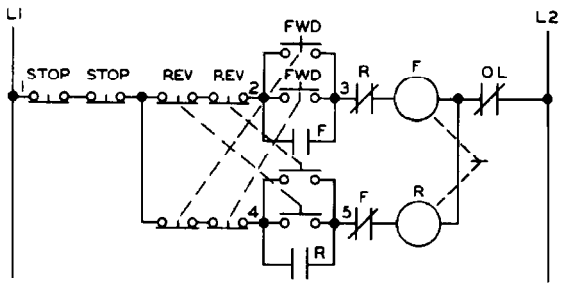
FIG. 6



3-wire control of a reversing starter can be implemented with a Forward-Reverse-Stop push button station as shown above. Limit switches may be added to stop the motor at a certain point in either direction. Jumpers 6 to 3 and 7 to 5 must then be removed.

3-Wire Control: Reversing Starter Multiple Push Button Station

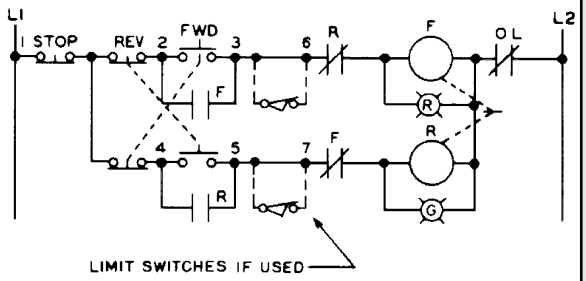
FIG. 1



More than one Forward-Reverse-Stop push button station may be required and can be connected in the manner shown above.

3-Wire Control: Reversing Starter w/ Pilot Lights to Indicate Motor Direction

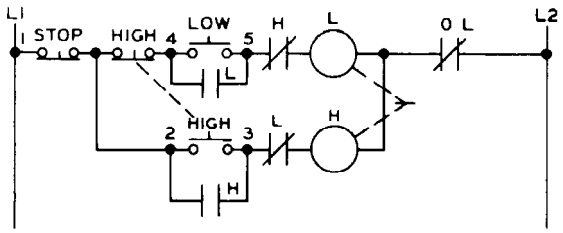
FIG. 2



Pilot lights may be connected in parallel with the forward and reverse contactor coils, indicating which contactor is energized and thus which direction the motor is running.

3-Wire Control: 2-Speed Starter

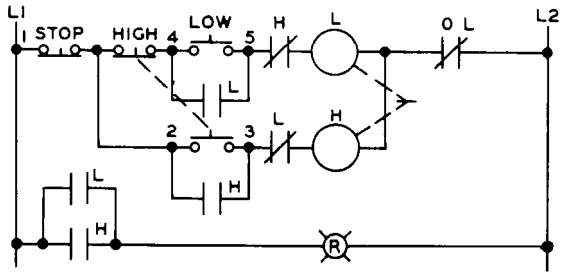
FIG. 3



3-wire control of a 2-speed starter with a High-Low-Stop push button station is shown above. This scheme allows the operator to start the motor from rest at either speed or to change from low to high speed. The Stop button must be operated before it is possible to change from high to low speed. This arrangement is intended to prevent excessive line current and shock to motor and driven machinery, which results when motors running at high speed are reconnected for a lower speed.

3-Wire Control: 2-Speed Starter w/ 1 Pilot Light to Indicate Motor Operation at Each Speed

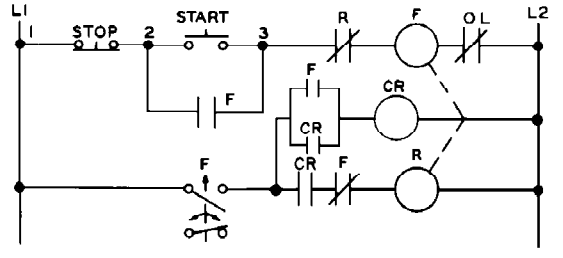
FIG. 4



One pilot light may be used to indicate operation at both low and high speeds. One extra normally-open auxiliary contact on each contactor is required. Two pilot lights, one for each speed, may be used by connecting pilot lights in parallel with high and low coils (see reversing starter diagram above).

Plugging: Plugging a Motor to a Stop from 1 Direction Only

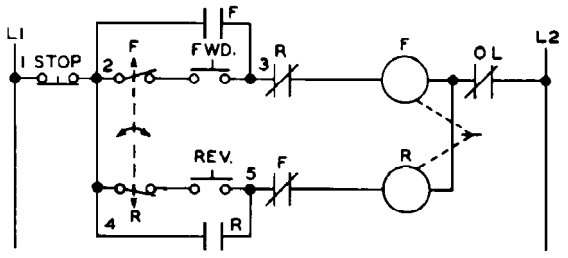
FIG. 5



Plugging is defined by NEMA as a braking system in which the motor connections are reversed so the motor develops a counter torque, thus exerting a retarding force. In the above scheme, forward rotation of the motor closes the normally-open plugging switch contact and energizing control relay CR. When the Stop push button is operated, the forward contactor drops out, the reverse contactor is energized through the plugging switch, control relay contact and normally-closed forward auxiliary contact. This reverses the motor connections and the motor is braked to a stop. The plugging switch then opens and disconnects the reverse contactor. The control relay also drops out. The control relay makes it impossible for the motor to be plugged in reverse by rotating the motor rotor closing the plugging switch. This type of control is not used for running in reverse.

Anti-Plugging: Motor to be Reversed but Must Not be Plugged

FIG. 6



Anti-plugging protection is defined by NEMA as the effect of a device that operates to prevent application of counter-torque by the motor until the motor speed has been reduced to an acceptable value. In the scheme above, with the motor operating in one direction, a contact on the anti-plugging switch opens the control circuit of the contactor used for the opposite direction. This contact will not close until the motor has slowed down, after which the other contactor can be energized.

Shunting Thermal Units During Starting Period

Article 430-35 of the NEC describes circumstances under which it is acceptable to shunt thermal units during abnormally long accelerating periods.

430-35. Shunting During Starting Period.

(a) Nonautomatically Started. For a nonautomatically started motor, the overload protection shall be permitted to be shunted or cut out of the circuit during the starting period of the motor if the device by which the overload protection is shunted or cut out cannot be left in the starting position and if fuses or inverse time circuit breakers rated or set at not over 400 percent of the full-load current of the motor are so located in the circuit as to be operative during the starting period of the motor.

(b) Automatically Started. The motor overload protection shall not be shunted or cut out during the starting period if the motor is automatically started.

Exception. The motor overload protection shall be permitted to be shunted or cut out during the starting period on an automatically started motor where:

(1) The motor starting period exceeds the time delay of available motor overload protective devices, and

(2) Listed means are provided to:

a. Sense motor rotation and to automatically prevent the shunting or cut out in the event that the motor fails to start, and

b. Limit the time of overload protection shunting or cut out to less than the locked rotor time rating of the protected motor, and

c. Provide for shutdown and manual restart if motor running condition is not reached.

Figures 1 and 2 show possible circuits for use in conjunction with 3-wire control schemes. Figure 1 complies with NEC requirements. Figure 2 exceeds NEC requirements, but the additional safety provided by the zero speed switch might be desirable.
Figure 3 shows a circuit for use with a 2-wire, automatically started control scheme that complies with NEC requirements. UL or other listed devices must be used in this arrangement.

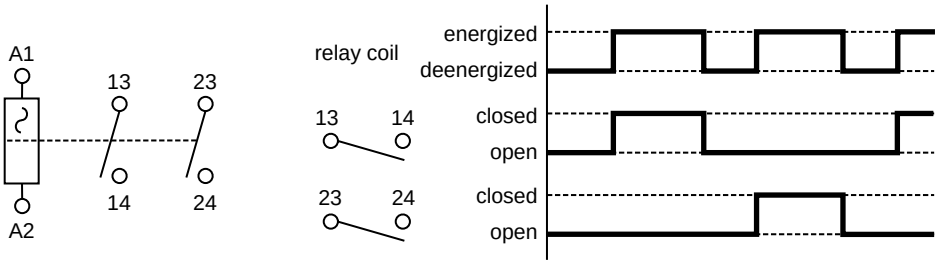
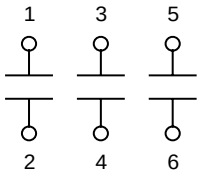
Alternating Relays: Class 8501 Type PHA

FIG. 3



Power Terminals

FIG. 1



Power terminals on contactors, overloads and switches are single digits – odd for line side terminals and even for load side terminals.

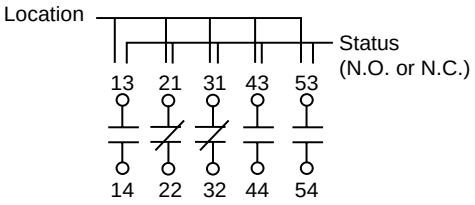
Coil Terminals

FIG. 2

Coil terminals are designated by a letter and a number. Terminals for a single winding coil are designated “A1” and “A2”.

Auxiliary Contact Terminals

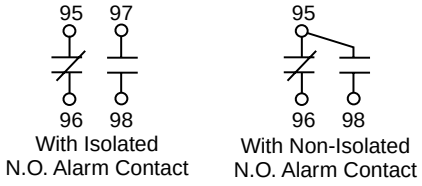
FIG. 3



Auxiliary contacts on contactors, relays and push button contacts use 2-digit terminal designations, as shown in the diagram above. The first digit indicates the location of the contact on the device. The second digit indicates the status of the contacts, N.O. or N.C. “1” and “2” indicate N.C. contacts. “3” and “4” indicate N.O. contacts.

Overload Relay Contact Terminals

FIG. 4



Overload contact terminals are marked with two digits. The first digit is “9”. The second digits are “5” and “6” for a N.C. and “7” and “8” for a N.O. isolated contact. If the device has a non-isolated alarm contact (single pole), the second digits of the N.O. terminals are “5” and “8”.

FIG. 1

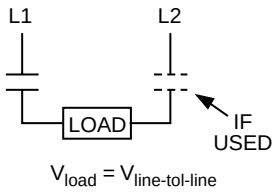
Load Connections for AC Lighting Contactors: Class 8903

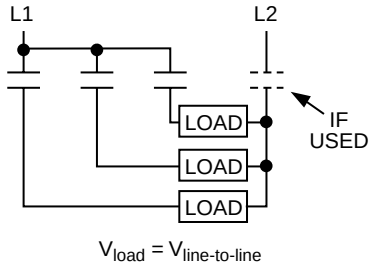
FIG. 1



$V_{load} = V_{line\text{-}tol\text{-}line}$

1-Phase, 2-Wire, Single Load

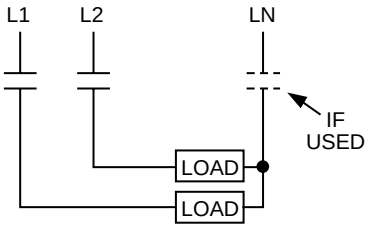
FIG. 2



$V_{load} = V_{line\text{-}to\text{-}line}$

1-Phase, 2-Wire, Multiple Loads

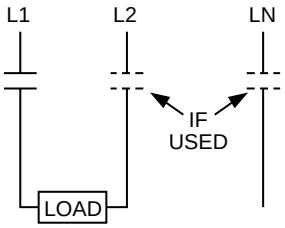
FIG. 3



$V_{load} = V_{line\text{-}to\text{-}neu\text{-}}$

1-Phase, 3-Wire, Loads Connected Line-to-Neutral

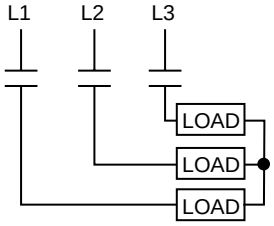
FIG. 4



$V_{load} = V_{line\text{-}to\text{-}line}$

1-Phase, 3-Wire, Load Connected Line-to-Line

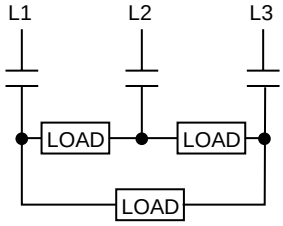
FIG. 5



$V_{load} = \frac{V_{line\text{-}to\text{-}line}}{1.732}$

3-Phase, 3-Wire, Wye-Connected Load

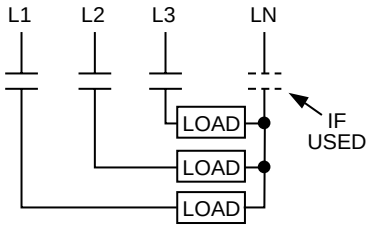
FIG. 6



$V_{load} = V_{line\text{-}to\text{-}line}$ $\quad I_{load} = \frac{I_{contacts}}{1.732}$

3-Phase, 3-Wire, Delta-Connected Load

FIG. 7



$V_{load} = V_{line\text{-}to\text{-}neu\text{-}}$

3-Phase, 4-Wire, Loads Connected Line-to-Neutral

Application Limits:

1. Voltage between line side conductors must not exceed line-to-line voltage rating of contactor.
2. V_{load} must not exceed volts-per-load rating of contactor.
3. Line current carried by any contact must not exceed ampere rating of contactor.

For contact ratings, refer to the Square D Digest.

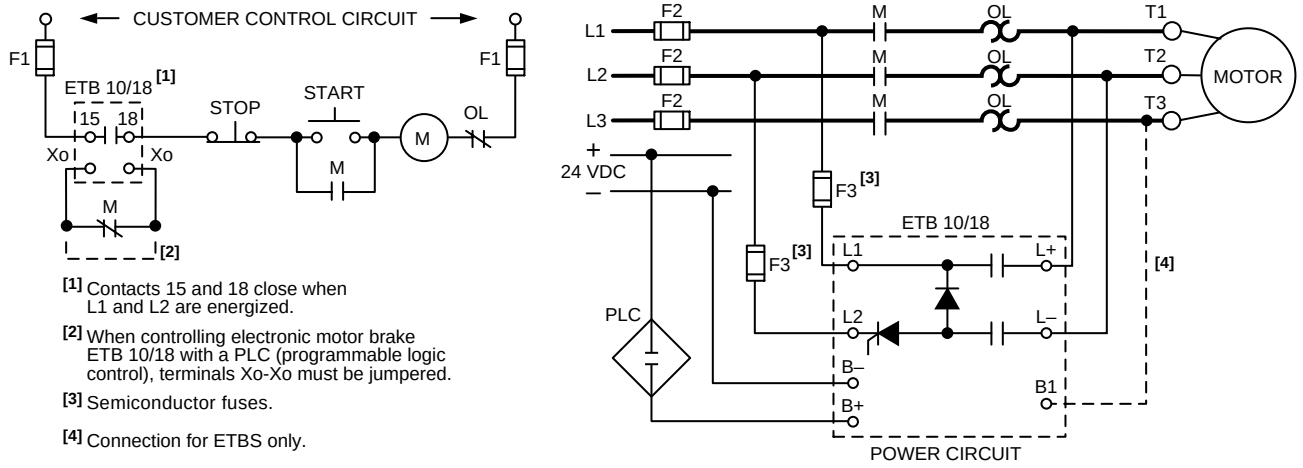
L = Line (common)
O = Open (unlatch)
C = Close (latch)

Omit middle pole for 2-pole unit

Power Circuit

QWIK-STOP® Electronic Motor Brake: Class 8922

FIG. 5



[1] Contacts 15 and 18 close when L1 and L2 are energized.

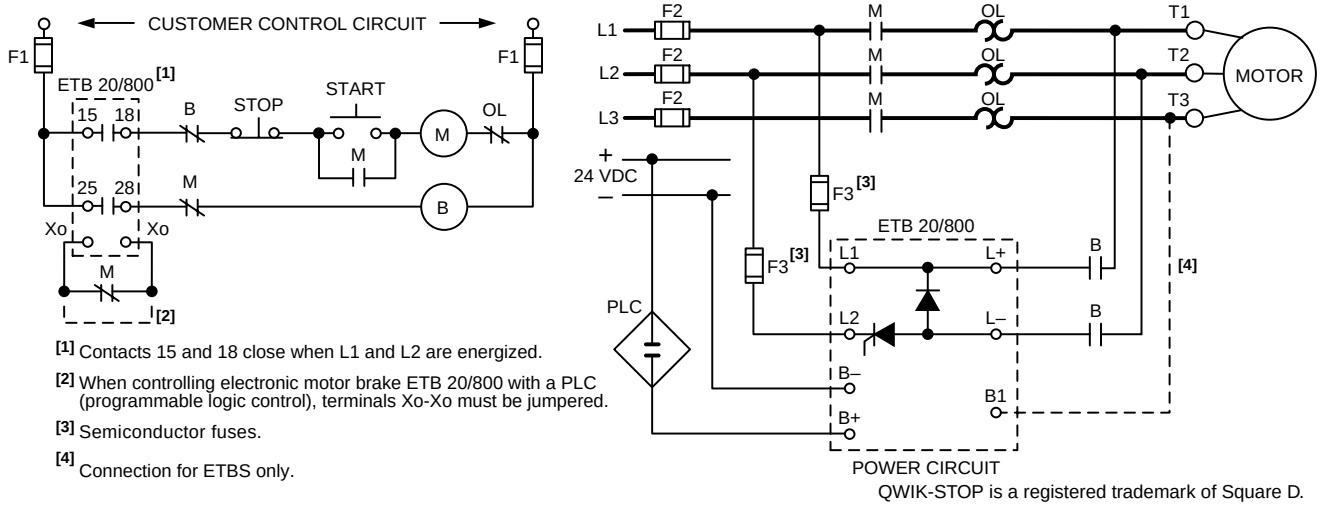
[2] When controlling electronic motor brake ETB 10/18 with a PLC (programmable logic control), terminals Xo-Xo must be jumpered.

[3] Semiconductor fuses.

[4] Connection for ETBS only.

Type ETB10, ETB18 and ETBS18 w/ Internal Braking Contactor

FIG. 6



[1] Contacts 15 and 18 close when L1 and L2 are energized.

[2] When controlling electronic motor brake ETB 20/800 with a PLC (programmable logic control), terminals Xo-Xo must be jumpered.

[3] Semiconductor fuses.

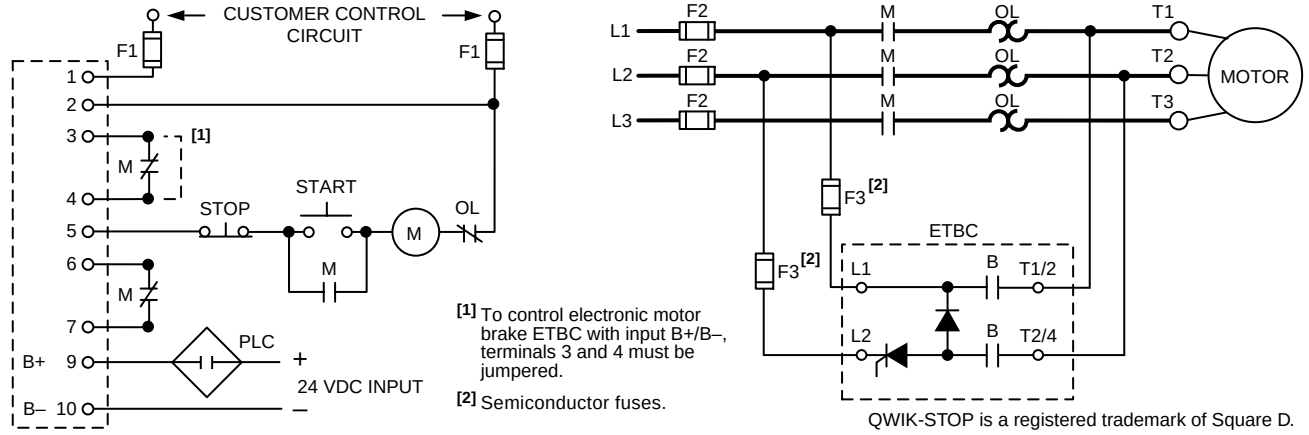
[4] Connection for ETBS only.

QWIK-STOP is a registered trademark of Square D.

Type ETB20-ETB800 and ETBS20-ETBS800

QWIK-STOP® Electronic Motor Brake: Class 8922 Type ETBC

FIG. 1



[1] To control electronic motor brake ETBC with input B+/B–, terminals 3 and 4 must be jumpered.

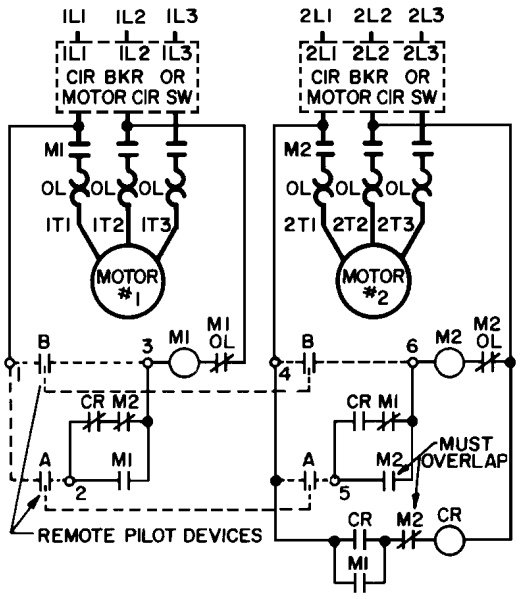
[2] Semiconductor fuses.

QWIK-STOP is a registered trademark of Square D.

Type ETBC

AC Duplex Motor Controller: Class 8941

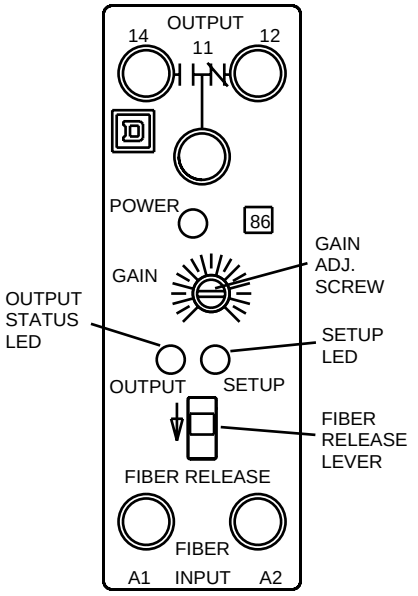
FIG. 2



Elementary Diagram for Duplex Motor Controller w/ Electric Alternator

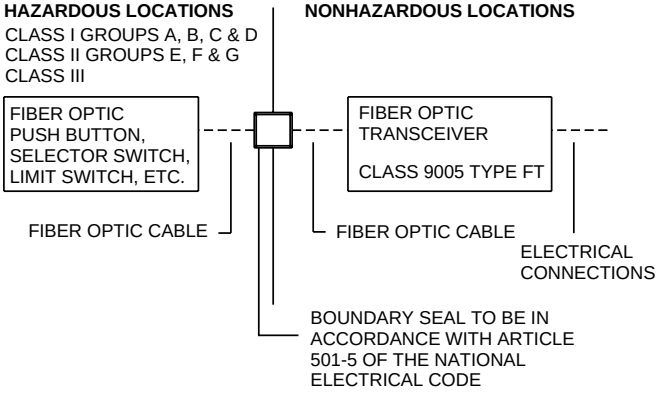
Fiber Optic Transceiver: Class 9005

FIG. 3



Transceiver, Front View

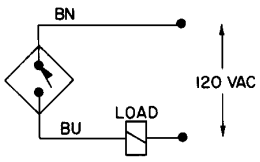
FIG. 4



Location

Photoelectric Switches: Class 9006 Type PE1 (Obsolete)

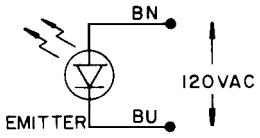
FIG. 1



Connect load in series. To prevent damage, all switches except emitters must have load connected to switch.

2-Wire AC, Single Device Operation

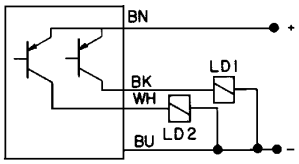
FIG. 2



AC thru-beam emitter has no output switching capability, therefore leakage current is not applicable. Thru-beam emitter is connected directly across the AC line and typically draws 15 mA.

AC Emitter

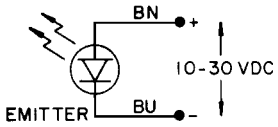
FIG. 3



DC switches cannot be wired in series. To prevent damage, all switches except emitters must have load connected to switch.

4-Wire DC, Single Device Operation, 10-30 VDC, 250 mA Max. Load

FIG. 4

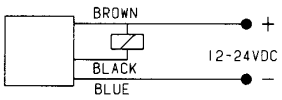


DC thru-beam emitter has no output switching capability, therefore it requires only a 2-wire cable connected directly across the DC. Thru-beam emitter draws a maximum of 45 mA.

DC Emitter

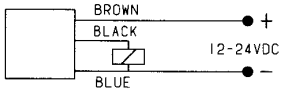
Photoelectric Switches: Class 9006 Type PE6 and PE7 (Obsolete)

FIG. 5



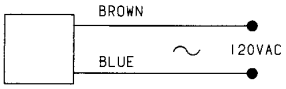
12-24 VDC, Sinking (NPN)

FIG. 6



12-24 VDC, Sourcing (PNP)

FIG. 7



120 VAC, Emitter Only

These switches are light operated only.

Beam broken = load deenergized
Beam unbroken = load energized

Photoelectric Switches: Class 9006 Type PEA120 (Obsolete)

FIG. 8

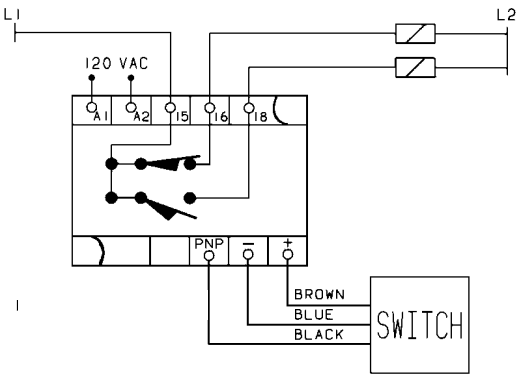


Diagram shows contact arrangement with beam broken.

[1] Unless otherwise permitted in the Code, the overcurrent protection for conductor types marked with an with an obelisk (†) shall not exceed 15 A for No. 14, 20 A for No. 12 and 30 A for No. 10 copper, or 15 A for No. 12 and 25 A for No. 10 aluminum after any correction factors for ambient temperature and number of conductors have been applied.

[2] On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads such as electric discharge lighting, electronic computer/data processing, or similar equipment there are harmonic currents present in the neutral conductor and the neutral shall be considered to be a current-carrying conductor.

[3] #8 XHHW copper wire requires 3/4" conduit for 3W.

[4] #6 XHHW copper wire requires 1" conduit for 3Ø4W.

[5] 400 kcmil aluminum wire requires 3" conduit for 3Ø4W.

Ampacity Correction Factors:
For ambient temperatures other than 30 °C (86 °F), multiply the ampacities listed in Table 8 by the appropriate factor listed in Table 9.

Adjustment Factors:
Where the number of current-carrying conductors in a raceway or cable exceeds three, reduce the allowable ampacities as shown in Table 9.

Table 9 Ampacity Correction Factors

Ambient Temperature (°C)	75 °C (167 °F) Conductors	90 °C (194 °F) Conductors	Ambient Temperature (°F)
21-25	1.05	1.04	70-77
26-30	1.00	1.00	78-86
31-35	.94	.96	87-95
36-40	.88	.91	96-104
41-45	.82	.87	105-113
46-50	.75	.82	114-122
51-55	.67	.76	123-131
56-60	.58	.71	132-140
61-70	.33	.58	141-158
71-80	…	.41	159-176

Table 10 Adjustment Factors

No. of Current-Carrying Inductors	Values in Tables as Adjusted for Ambient Temperature
4-6	80%
7-9	70%
10-20	50%
21-30	45%
31-40	40%
41 and above	35%

For exceptions, see exceptions to Note 8 of NEC® Table 310-16.

Ratings for 120/240 V, 3-Wire, Single-Phase Dwelling Services:
The ratings in Table 11 are permitted ratings for dwelling unit service and feeder conductors which carry the total load of the dwelling. The grounded conductor (neutral) shall be permitted to be not more than 2 AWG sizes smaller than the ungrounded conductors, provided the requirements of 215-2, 220-22 and 230-42 are met.

Table 11 Ratings for 120/240 V, 3-Wire, Single-Phase Dwelling Services – see NEC 310-16 Note 3

Rating (A)	100	110	125	150	175	200	225	250	300	350	400
Copper	4 AWG	3 AWG	2 AWG	1 AWG	1/0 AWG	2/0 AWG	3/0 AWG	4/0 AWG	250 kcmil	350 kcmil	400 kcmil
Aluminum	2 AWG	1 AWG	1/0 AWG	2/0 AWG	3/0 AWG	4/0 AWG	250 kcmil	300 kcmil	350 kcmil	500 kcmil	600 kcmil

NEC 240-3 Protection of Conductors:
Conductors, other than flexible cords and fixture wires, shall be protected against overcurrent in accordance with their ampacities as specified in NEC Section 310-15, unless otherwise permitted in parts (a) through (m).

NEC 220-3 (a) Continuous and Noncontinuous Loads:
The branch circuit rating shall not be less than the noncontinuous load plus 125% of the continuous load (see exception for 100% rated devices).

NEC 220-10 (b) Continuous and Noncontinuous Loads:
Where a feeder supplies continuous loads or any combination of continuous and noncontinuous loads, the rating of the overcurrent device shall not be less than the noncontinuous load plus 125% of the continuous load (see exception for 100% rated devices).

NEC 430-22 (a) Single Motor Circuit Conductors:
Branch circuit conductors supplying a single motor shall have an ampacity not less than 125% of the motor full-load current rating (see exceptions).

Table 12 AWG and Metric Wire Data

AWG Size	Conductor dia. (mm)	Conductor dia. (in)	Resistance @ 20 °C (68 °F)		AWG Size	Conductor dia. (mm)	Conductor dia. (in)	Resistance @ 20 °C (68 °F)

Table 13 Electrical formulas for Amperes, Horsepower, Kilowatts and KVA

To find	Single phase	3-phase	Direct current
Kilowatts	$\frac{I \times E \times PF}{1000}$	$\frac{I \times E \times 1.73 \times PF}{1000}$	$\frac{I \times F}{1000}$
KVA	$\frac{I \times E}{1000}$	$\frac{I \times E \times 1.73}{1000}$	—
Horsepower (output)	$\frac{I \times E \times \%\,Eff \times PF}{746}$	$\frac{I \times E \times 1.73 \times \%Eff \times PF}{746}$	$\frac{I \times E \times \%Eff}{746}$
Amperes when Horsepower is known	$\frac{HP \times 746}{E \times \%Eff \times PF}$	$\frac{HP \times 746}{1.73 \times E \times \%Eff \times PF}$	$\frac{HP \times 746}{E \times \%Eff}$
Amperes when Kilowatts is known	$\frac{KW \times 1000}{E \times PF}$	$\frac{KW \times 1000}{1.73 \times E \times PF}$	$\frac{KW \times 1000}{E}$
Amperes	$\frac{KVA \times 1000}{E}$	$\frac{KVA \times 1000}{1.73 \times E}$	—

E=Volts I = Amperes %Eff = Percent efficiency PF = Power factor HP = Horsepower KVA = Kilovolt-Amps

Average Efficiency and Power Factor Values of Motors:

When actual efficiencies and power factors of the motors to be controlled are not known, the following approximations may be used:

Efficiencies:

DC motors, 35 hp and less:	80% to 85%
DC motors, above 35 hp:	85% to 90%
Synchronous motors (at 100% PF):	92% to 95%

"Apparent" efficiencies (Efficiency x PF):

3-phase induction motors, 25 hp and less:	70%
3-phase induction motors above 25 hp:	80%

Decrease these figures slightly for single phase induction motors.

Table 14 Ratings for 3-Phase, Single-Speed, Full-Voltage Magnetic Controllers for Nonplugglng and Nonjogging Duty

Size of Controller	Continous Current Rating (A)	Horsepower at [1]				Service-Limit Current Rating (A)
		60 Hz 200 V	60 Hz 230 V	50 Hz 380 V	60 Hz 460 or 575 V	
00	9	1-1/2	1-1/2	1-1/2	2	11
0	18	3	3	5	5	21
1	27	7-1/2	7-1/2	10	10	32
2	45	10	15	25	25	52
3	90	25	30	50	50	104
4	135	40	50	75	100	156
5	270	75	100	150	200	311
6	540	150	200	300	400	621
7	810	—	300	—	600	932

[1] These horsepower ratings are based on typical locked-rotor current ratings. For motors having higher locked-rotor currents, use a larger controller to ensure its locked-rotor current rating is not exceeded.

Table 15 Ratings for 3-Phase, Single-Speed, Full-Voltage Magnetic Controllers for Plug-Stop, Plug-Reverse or Jogging Duty

Size of Controller	Continous Current Rating (A)	Horsepower at [1]				Service-Limit Current Rating (A)
		60 Hz 200 V	60 Hz 230 V	50 Hz 380 V	60 Hz 460 or 575 V	
0	18	1-1/2	1-1/2	1-1/2	2	21
1	27	3	3	5	5	32
2	45	7-1/2	10	15	15	52
3	90	15	20	30	30	104
4	135	25	30	50	60	156
5	270	60	75	125	150	311
6	540	125	150	250	300	621

[1] These horsepower ratings are based on typical locked-rotor current ratings. For motors having higher locked-rotor currents, use a larger controller to ensure its locked-rotor current rating is not exceeded.

Table 16 Power Conversions

From	to kW	to PS	to hp	to ft-lb/s
1 kW (kilowatt) = 10^{10} erg/s	1	1.360	1.341	737.6
1 PS (metric horsepower)	0.7355	1	0.9863	542.5
1 hp (horsepower)	0.7457	1.014	1	550.0
1 ft-lb/s (foot-pound per sec)	1.356×10^{-3}	1.843×10^{-3}	1.818×10^{-3}	1

From single products to complete systems, look to Square D.

Square D Company is a leading manufacturer and supplier of electrical distribution, automation and industrial control products. The full line of Square D and Telemecanique brand products are available from an extensive network of Square D distributors located throughout North America.

Square D Company is part of Groupe Schneider, an $11 billion global manufacturer of electrical distribution, automation and industrial equipment, a company whose primary business resides in those markets.

Square D has been serving industrial and construction markets, as well as public utilities, individual consumers and government agencies for over 85 years. We offer unsurpassed quality, innovative design and a committed staff of trained sales representatives and service technicians willing to stand behind every product we sell.

For further information on how we can help fill your electrical needs, call your local Square D field representative or authorized Square D distributor.
